

# Conceptual Design for Relational Databases

-

Most common errors  
...to avoid

# Error #1 – foreign keys

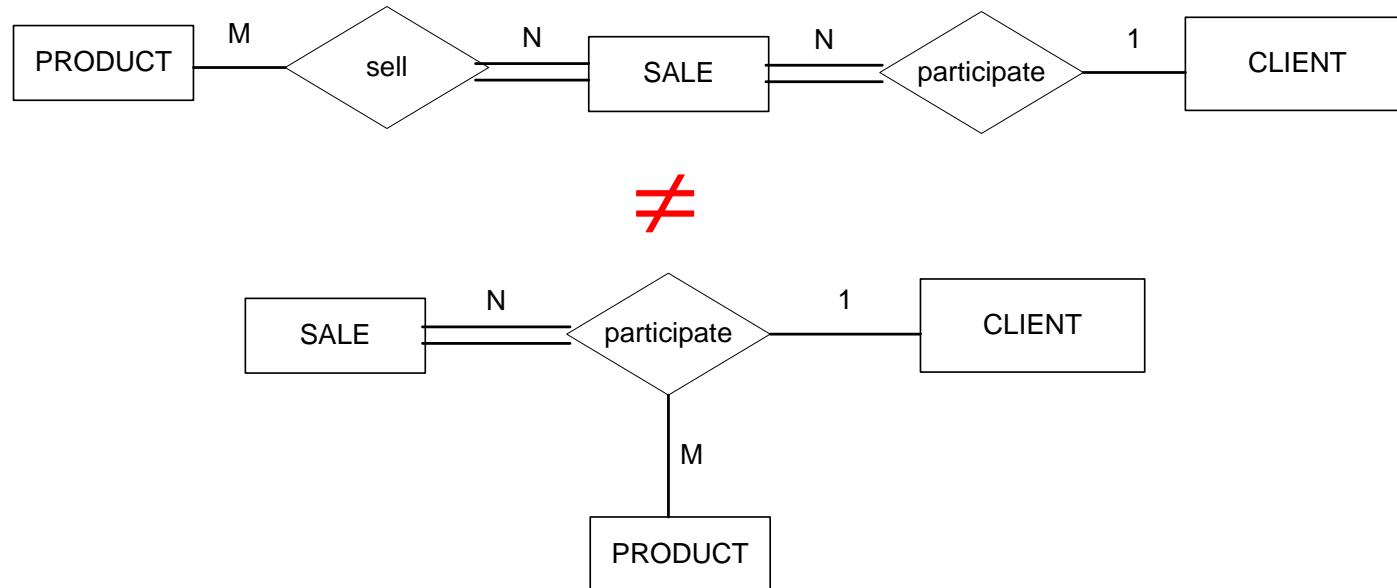

**ERROR:** *represent foreign keys in ER diagrams*

**The concept of foreign key does not exist in ER diagrams,  
only on relational tables**

## Error #2 – randomly replacing relationships

**ERROR:** *replace binary relationships with ternary (or above) relationships... randomly*

**A ternary relationship is DIFERENT from two individual binary relationships**

## Error #3 – unnamed relationships

**ERROR:** *define relationships without an adequate verb*

? = close? open? deactivate?

**Always name relationships using verbs in their base form**

## Error #4 – plural naming

---

**ERROR:** *name attributes and entities using plural nouns*

CLIENTS

**Relationship and attributes require a noun in its singular form**

# Error #5 – incorrect representation of concepts

---

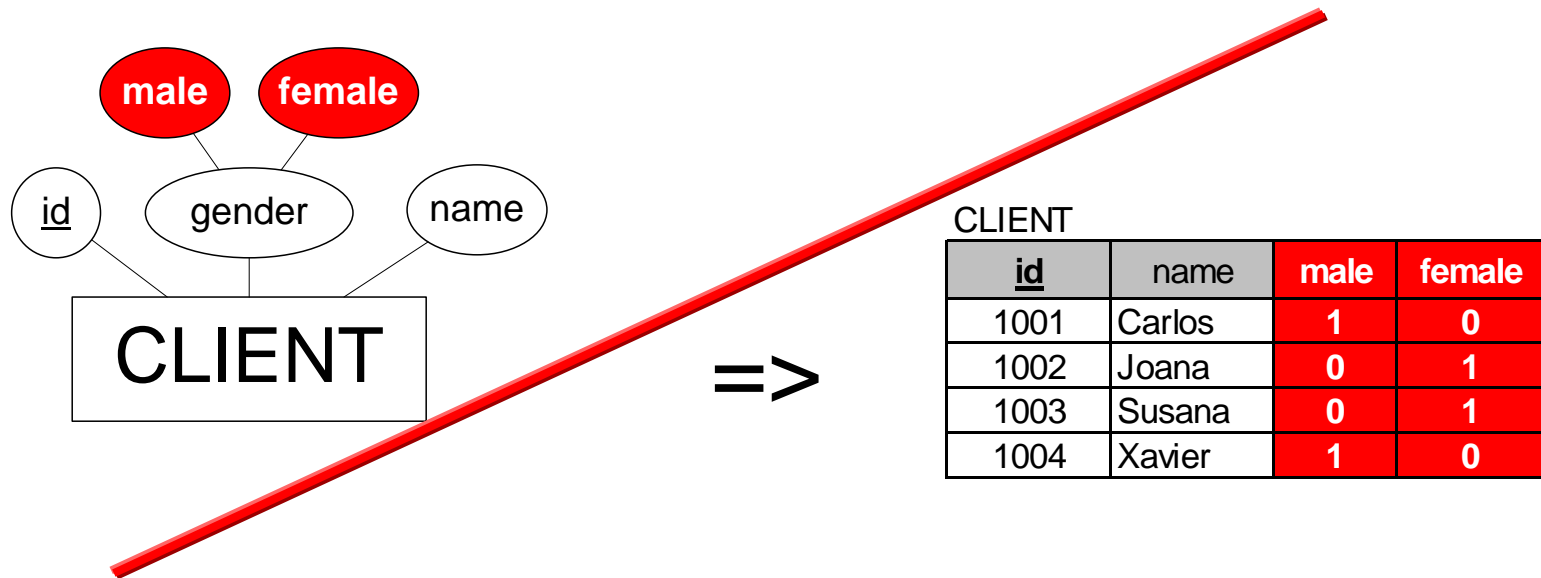

**ERROR:** *represent entities with elipses*

**<no comments...>**

# Error #6 – domain representation

**ERROR:** *use composite attributes to represent domains*

**Represent a composite attribute to specify the parts in which it must be decomposed (for storage or querying purposes)**

# Error #7 – wrong inheritance design

**ERROR:** *PKs in sub entities*

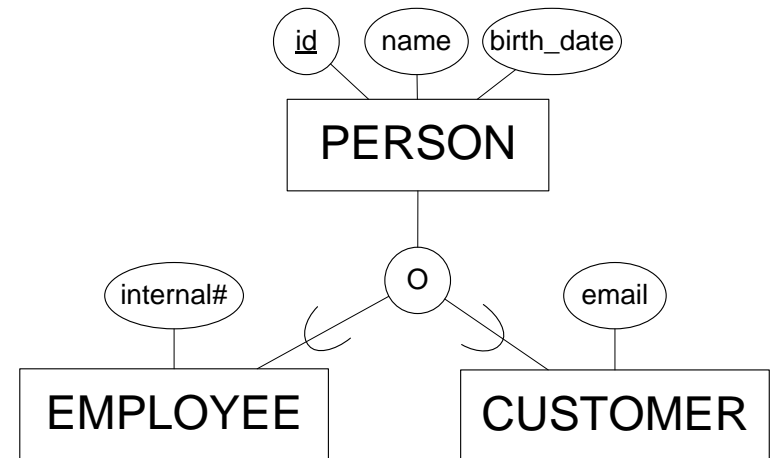

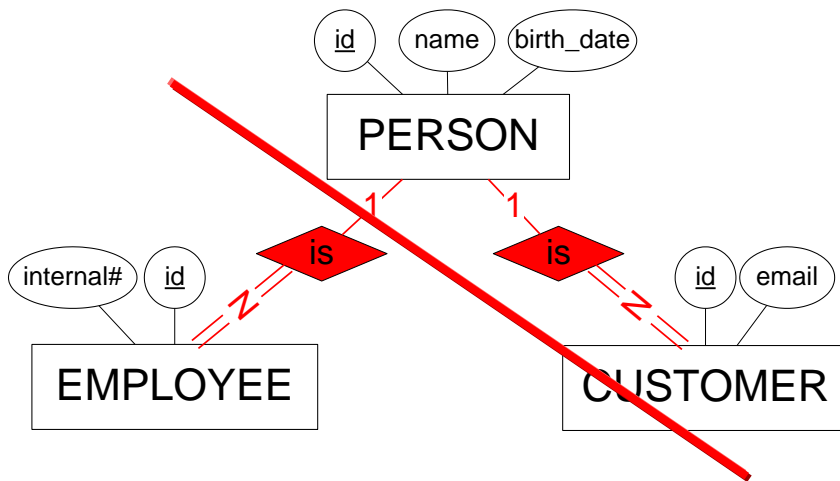

**Every subentity always inherits the super entity's attributes**

# Error #8 – representing sets and subsets

**ERROR:** *represent sets and subsets with relationships instead of hierarchies*

**SUBSETS** are represented using hierarchies, not as independent entities

# Error #9 – missing relationships

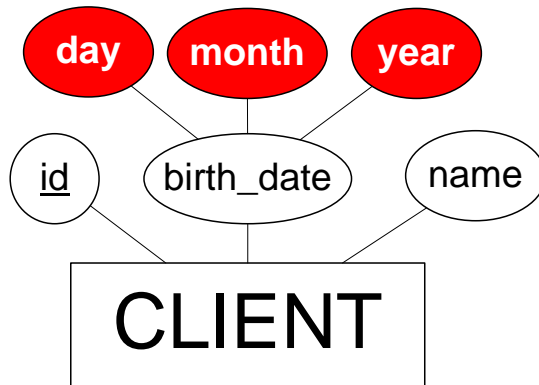

**ERROR:** *connect entities directly*

**Relationships and hierarchies are  
the ONLY method for relating entities**

# Error #10 – decomposing dates

**ERROR:** *separate dates into their subvalues (if that is not what you need)*

=>

CLIENT

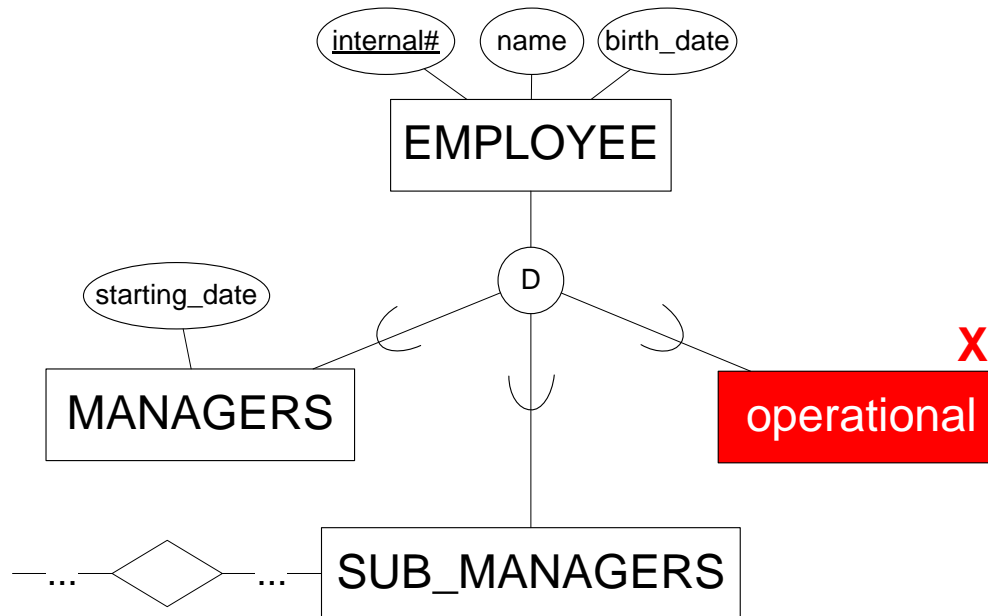

<u>id</u>	name	day	month	year
1001	Carlos	1	10	2000
1002	Joana	17	9	1998
1003	Susana	18	1	2000
1004	Xavier	5	3	1999

*(is this what you need?)*

**Dates are complex values: they naturally aggregate several concepts. Leave dates alone!**

# Error #11 – alone sub entities

**ERROR:** *represent sub entities with no practical purpose*

**Represent a sub entity ONLY when it has relationships with other entities OR when it has attributes of its own.**

## Error #12 – lack of practice

---

**ERROR:** *to neglect the importance of practice*

*«We are what we repeatedly do. Excellence, then, is not an act but a habit. »*

Aristotle

**Practice will hopefully lead you towards the error.  
The error will often lead you to understanding.  
If you make no mistakes, you will learn nothing.**
